Animal Models & Veterinary Research

Tackling key challenges in the life sciences with advanced biological tools

Introduction

Animal models

An animal model is an animal with a disease either the same as or like a disease in humans. Animal models are used to study the development and progression of diseases and to test new treatments before they are given to humans¹.

Veterinary research

Veterinary research includes research on prevention, control, diagnosis, and treatment of diseases of animals and on the basic biology, welfare, and care of animals. Veterinary research transcends species boundaries and includes the study of spontaneously occurring and experimentally induced models of both human and animal disease and research at human-animal interfaces, such as food safety, wildlife and ecosystem health, zoonotic diseases, and public policy².

"Between animal and human medicine there is no dividing line—nor should there be. The object is different but the experience obtained constitutes the basis of all medicine."

Rudolf Virchow (1821–1902)

	Rabbit IgG ELISA Kit	ab187400
	Recombinant rabbit TIGIT protein	ab224645

Comparison sequence homology

If you are looking for an antibody and you cannot find a commercial one available for your protein target tested in your species of interest...This is for you!

Antibodies against a human protein usually recognises the homologous protein in other species like mouse, monkey, rat etc. This is due to the percentage of homology between both proteins. "Percent homology" is often used to mean "sequence similarity." The percentage of identical residues is a parameter commonly used to quantify the homology between proteins.

We consider that to have probabilities of cross-reactivity the homology between the immunogen and the protein target of interest should be higher than 85%. This is debatable based on antibody clonality. For polyclonals raised against large protein fragments, cross reaction at lower homologies is more likely than with monoclonals. Therefore we evaluate the percentage of homology and possibilities to success case by case.

If you are interested in using one of our antibodies. Please contact our Scientific Support team and we will check the homology for you. Also you can take part in our Abtrial program at www.abcam.com/abtrial-program.

BLAST (Basic Local Alignment Search tools)

This program compares nucleotide or protein sequences to sequence databases and calculates the statistical significance. This helps you checking the homology between the immunogen and your target protein.

The program compares nucleotide or protein sequences to sequence databases and calculates the statistical significance

The screenshot shows the NCBI BLAST web interface. The 'Enter Query Sequence' section has a text box for the query sequence, which is highlighted with a red box and labeled '1'. The 'Choose Search Set' section has a dropdown for 'Organism' and a text box for 'Enter organism common name, binomial, or tax id', which is highlighted with a red box and labeled '2'. The 'Program Selection' section has radio buttons for different algorithms, with 'blastp (protein-protein BLAST)' selected, highlighted with a red box and labeled '3'. The 'BLAST' button is at the bottom left, highlighted with a red box.

Use BLAST now

1 Copy here the immunogen sequence

2 Select your species of interest from the list

3 BLAST

Custom antibody solutions

For research and diagnostic development

What we offer

Integrated platform to deliver fully characterized antibody candidates for therapeutic and diagnostic selection.

Advantages:

- Flexible strategic approach
- Proven success in RUO and commercial markets
- IP protection
- Multiple antibody discovery platforms, including RabMAb® & RabMAb®-NGS technology and phage display platform.
- ISO 13485, ISO 9001 and GMP Quality Systems

We also offer custom antibody conjugation*, including:

- Alexa Fluor® dyes (405, 488, 555, 568, 594, 647, 680, 750, 790)
- FITC, HRP, Biotin, R-PE, APC, PerCP
- Oligo-conjugates for NanoString GeoMx™ Digital Spatial Profiler (DSP)

*Minimum 1mg

Explore FAQs of our custom solutions

RabMAb® and RabMAb®-NGS technology

Our RabMAb® technology combines the superior antigen recognition of the rabbit immune system with the specificity and consistency of a mouse monoclonal. High affinity, high specificity, high consistency. Fully harness the potential of our RabMAb technology with the power of next-generation sequencing (NGS).

Benefits	RabMAb®	RabMAb®- NGS
High affinity RabMAb® antibodies have high affinity and enhanced performance.	✓	✓
Superior performance Unparalleled recognition of small epitopes, including post-translational modifications, small molecules, short peptides, point mutations, and conformational epitopes.	✓	✓
Find unique binders With wider epitope recognition, we can generate a broader range of antibodies recognizing unique epitopes.	✓	✓
Relevant species binding Rabbit offers options for human, NHP and mouse/rat cross reactivity, giving coverage of preferred species for project progression.	✓	✓
Identify rare binders Even greater pool of candidates compared with traditional hybridoma method. Even better support of discovery efforts for functionally relevant diagnostic and therapeutic antibodies.	×	✓
Navigate challenging IP landscapes Provides a whole library of antibody sequences to support the resulting IP portfolio for legal protection around target binding.	×	✓
Complete bioinformatic support Proprietary bioinformatic support to permit rational clone selection and maximize lead discovery with both depth and breadth approaches.	×	✓

Seven FDA-approved companion diagnostic assays are created using our RabMAb® technology.

Phage display platform

When it is not feasible to use animal systems, we turn to our proprietary in vitro phage display technology to generate recombinant antibodies, at speed.

Use phage display to generate antibodies against

- Toxins
- Infectious agents
- Low immunogenicity targets
